### Unite and Conquer: Seller Collusion in Multi-Sided Markets

This paper explores the link between online marketplace design and seller competition. Using a game-theoretic model, we investigate how design choices, like pricing strategies, affect seller collusion and platform incentives. Our findings suggest that high transaction fees may foster collusion, and platforms can influence product variety and seller competition by raising its fees. Our framework also considers features like information disclosure and product numbers. This research contributes to the underexplored field of how multi-sided market design shapes online platform competition.

### Social (P)references: Testing Peer-Dependent Reference Points

Individual decisions are often thought to be made based solely on personal gain, but recent experimental and empirical evidence challenges this assumption. We present a new model that incorporates social aspects of decision-making under uncertainty, and propose two re-specifications of certainty equivalents for decision-makers with allocational concerns, as they may not be unique. Our research offers insight into the impact of peer effects on individual choices under risk, and we highlight the importance of precise specification of a peer-dependent certainty equivalent. Our findings suggest potential implications for various economic settings. We also test these predictions experimentally.
